Mr. Rawson • GCSE Computer Science Year 11 2026

GCSE Computer Science – What Have We Covered?

This is not a test and it is not marked. It tells me where to start, so be honest — guessing high costs you lessons you needed. Work down the list and tick **one** box per row.

✓ **Fine** — we did it and I could answer a question on it. ∼ **Shaky** — we did it, but I would struggle. × **New** — I do not think we covered this.

		✓ Fine	∼ Shaky	× New
Paper 1 — Computer systems (J277/01)				
1.1.1	How the CPU works — fetch–execute cycle, registers, von Neumann	☐	☐	☐
1.1.2	CPU performance — clock speed, cores, cache	☐	☐	☐
1.1.3	Embedded systems	☐	☐	☐
1.2.1	Primary storage — RAM and ROM	☐	☐	☐
1.2.2	Secondary storage — magnetic, optical, solid state	☐	☐	☐
1.2.3	Units and file sizes	☐	☐	☐
1.2.4	Binary, hexadecimal, character sets, images, sound	☐	☐	☐
1.2.5	Compression	☐	☐	☐
1.3.1	Networks — LAN/WAN, hardware, performance, topologies	☐	☐	☐
1.3.2	Protocols and layers — TCP/IP, the internet	☐	☐	☐
1.4.1	Network threats — malware, social engineering, hacking	☐	☐	☐
1.4.2	Preventing attacks — firewalls, encryption, passwords	☐	☐	☐
1.5	Systems software — operating systems and utilities	☐	☐	☐
1.6.1	Ethical, legal, cultural and environmental impacts	☐	☐	☐
Paper 2 — Computational thinking, algorithms and programming (J277/02)				
2.1.1	Computational thinking — abstraction, decomposition	☐	☐	☐
2.1.2	Algorithms — flowcharts, pseudocode, trace tables	☐	☐	☐
2.1.3	Searching and sorting algorithms	☐	☐	☐
2.2.1–2	Writing programs — variables, data types, if statements, loops	☐	☐	☐
2.2.3	Arrays, sub-programs, files, SQL	☐	☐	☐
2.3	Defensive design and testing	☐	☐	☐
2.4.1	Boolean logic — AND, OR, NOT, truth tables	☐	☐	☐
2.5	Programming languages, translators and the IDE	☐	☐	☐

Anything you remember doing that is not on this list?

____

____

Which one of these worries you most? ____________________________

Teacher master — CS 11 vs the inherited record

The **Recorded** column is what the handover notebook shows for this class's Y10 (capture: `RM Course Progression --- CS 2025-27.md`, 37 pages, ≈31 recorded lessons against ≈70 slots). The record understates what was taught, so a **Yes** means *introduced*, not secure — and a Yes the room ticks *shaky* is the most valuable thing this audit can surface. Tally the class of **7**; you are hunting disagreements, not totals.

		Recorded	Tally (of 7)		
			✓	∼	×
Paper 1 — Computer systems					
1.1.1	CPU — FDE cycle, registers, von Neumann	**Part**			
1.1.2	CPU performance	**Part**			
1.1.3	Embedded systems	**Yes**			
1.2.1	Primary storage	**Yes**			
1.2.2	Secondary storage	**Yes**			
1.2.3	Units and file sizes	**Yes**			
1.2.4	Binary, hex, characters, images, sound	**Yes**			
1.2.5	Compression	**Yes**			
1.3.1	Networks and topologies	**Yes**			
1.3.2	Protocols, layers, TCP/IP	**Yes**			
1.4.1	Network threats	**Yes**			
1.4.2	Preventing attacks	**No**			
1.5	Systems software	**No**			
1.6.1	Ethics, legal, cultural, environmental	**No**			
Paper 2 — Computational thinking, algorithms and programming					
2.1.1	Computational thinking	**No**			
2.1.2	Algorithms — design, pseudocode, tracing	**Part**			
2.1.3	Searching and sorting	**No**			
2.2.1–2	Programming fundamentals, data types	**No**			
2.2.3	Arrays, sub-programs, files, SQL	**No**			
2.3	Defensive design and testing	**No**			
2.4.1	Boolean logic	**Yes**			
2.5	Languages, translators, the IDE	**No**			

Detail worth probing, from the inherited record

- **Programming is three pages in the whole notebook** — trace tables, one Paper 2 question set, a printout. No variables, no data types, no sequence, no selection, no iteration. The one sighting of code is `if (X AND Y): print("Yes!!")` inside a Boolean lesson — notation *seen*, never written or run. Expect × ticks on 2.2; a ✓ there needs probing, not celebrating.
- **There is no test page anywhere in the notebook.** The only assessment-shaped artefact is a Paper 2 question set dated 5 May 2026. Assume almost no exam experience — timing, command words, mark-scheme habits are all unbuilt.
- **1.4 is half done** — threats (1.4.1) got five pages; the prevention half (1.4.2) got nothing. Students may tick Fine on "network security" as a whole; the split is the point.
- **1.1 is the weakest of the covered topics** — CPU as "the brain" plus one performance lesson; no fetch–execute, registers or von Neumann. The same weakness showed in the previous cohort, so it is a pattern, not an accident.

- **2.1.2 is Part for a narrow reason —** trace tables only: *reading* algorithms, never designing or writing them.

Also inherited: December 2025 is a six-week void — no page in any section. Whatever ran then is unrecorded, so a surprise ✓ cluster on a “No” row is worth believing and following up.
