Class: _____

Date: _____

Molecular Motion Model — Demo

How the model works

- The **51 steel balls** are the **particles**.
- The vibration generator shakes the container. That **gives the balls energy**, just as **heating** gives particles energy.
- A **higher voltage** shakes harder: it models a **higher temperature**.

At each setting, draw the balls, describe how they move, and name the state.

Supply	**1 V**	**2 V**	**5 V**
Draw the balls			
How they move			
State it models			

1) **Describe** how the movement of the balls changes as the supply goes from 1 V to 5 V. **[2]**

2) **Explain** what turning up the voltage models in a real substance. **[2]**

3) **Explain** why the same balls take up much more space at 5 V, and what this tells you about the density of a gas. **[2]**
