1.1 – Homework — Make Something of Your Own

Unit 1: Robotics & Control

The task

Go back into MakeCode and **make something of your own**. Then **name it**, **publish it**, and **submit the sharing link on Google Classroom** before our next lesson on **Thursday 10 September**.

This is open-ended on purpose. It is not graded — what matters is that you experimented, and that the link you submit opens and runs.

Three ways in — pick one, or invent your own

Route	What it looks like
Remix	Push what we did in class further: more frames, a longer animation, different speeds, a repeat loop, something different on button B.
New message	A different word or phrase, a pattern, a picture story told in frames — anything the 5×5 grid can carry.
Explore	Open a drawer we have not used — Logic or Variables — drag blocks in and see what they do. You cannot break anything. If it does something you did not expect, even better.

You do not need a micro:bit at home

The **simulator** — the virtual micro:bit on the left of the editor — runs your program exactly as the real board would. Everything in this homework works in the simulator alone.

Getting back in, from any computer

1. Go to `makecode.microbit.org` in any browser.
2. **If your projects list is empty, nothing is lost.** Projects are saved in the browser you used, so a different computer starts blank. To reopen your class project: **Import** → **Import URL...** → paste the sharing link written on your class handout → **Go ahead!** Or simply start a **New Project**.
3. Build. Name your project something sensible.

When you are done — publish and submit

1. In your project: **Share** → **Publish project**.
2. **Copy the link** and write it here as a backup:

My homework link: _____

3. Open the homework assignment on **Google Classroom** and **paste the link** into your submission, then hand it in. The link is the homework — there is nothing else to attach.

If things go wrong

- **Lost your link?** Open the project and publish again — you get a fresh link to the same program. If you lost the whole project, rebuild something small; that is fine.
- **Publishing changed my link?** Publishing again after edits gives a *new* link. Submit the newest one.
- **Forgotten how a block works?** Every drawer's blocks snap together in the workspace and run instantly in the simulator — experiment; you cannot break anything.

Before you hand in — tick each one

- ☐ I made something that was not built in class ☐ My project has a name ☐ I published it and copied the link ☐ I pasted the link into Google Classroom and clicked hand in
