Programming Challenge: Selection

Age Group Checker (HARD) — Answer Key

https://isaacomputerscience.org/questions/selection_hard

- Write a Python program that asks the user for their age and prints whether they are a Child (under 12), a Teenager (12 to 17), an Adult (18 to 64), or a Pensioner (65 or older).

Example Output:

```
> Enter your age: 70  
  
Pensioner
```

Previous Knowledge Needed

- Input converted with `int()` (line 2)
- IF, ELIF and ELSE (line 5)
- ELIF order: each `elif` is only checked if the ones above were False (line 11)

Alfred's answer, v2.

```
1 # asks the user for their age = int(input())  
2 age = int(input("Enter your age: "))  
3  
4 # a Child (under 12) = if age < 12:  
5 if age < 12:  
6     print("Child")  
7  
8 # a Teenager (12 to 17) = elif age < 18:  
9 # elif is only checked if the if above was False,  
10 # so here age is already 12 or more: < 18 means 12 to 17  
11 elif age < 18:  
12     print("Teenager")  
13  
14 # an Adult (18 to 64) = elif age < 65:  
15 # here age is already 18 or more: < 65 means 18 to 64  
16 elif age < 65:  
17     print("Adult")  
18  
19 # or a Pensioner (65 or older) = else:  
20 # every age left over is 65 or more  
21 else:  
22     print("Pensioner")  
23  
24 # if, elif, elif, else = only ONE of the four messages is ever printed
```
