

Name: _____

Class: _____

Mr. Rawson • GCSE Computer Science

Year 11 2026

Programming Quiz 1

Time: 25 minutes **Total:** 25 marks

Answer **all** the questions. Write your answers on the dashed lines. You may write code in Python or in OCR Exam Reference Language.

Every question here is a **real OCR exam question**, set out the way it appears on the paper. Question 9 is a stretch: do it last.

- 1 Tick (✓) **one** box in each row to identify the programming construct where each keyword is used.

Keyword	Programming construct	
	Selection	Iteration
if		
for		
while		

[3]

OCR J277 · ExamBuilder Q56

- 2 Write pseudocode to increment a value held in a variable `score` by one.

[1]

OCR J277 · ExamBuilder Q47(a)

- 3 The result of a computer game can be a win, a loss or a draw. The result is stored in a variable with the identifier `result`.

- (i) State why `result` **cannot** be stored using a Boolean data type.

[1]

- (ii) Give a suitable data type for `result`. Explain your answer, showing how each result could be stored.

Data type -----

Explanation -----

[2]

OCR J277 · ExamBuilder Q51(b)

- 4 In a computer game, a player collects items. Each item has a score. The score for each item is stored using the data type **real**.

State what is meant by the data type **real**.

----- [1]

OCR J277 · ExamBuilder Q51(c)

- 5 Tick (✓) **one** box in each row to identify if each operator is a comparison operator or an arithmetic operator.

Operator	Comparison	Arithmetic
==		
+		
DIV		
>		

[4]

OCR J277 · ExamBuilder Q52

- 6 DIV and MOD are both operators used in computing-related mathematics.

(i) State the value of 13 DIV 4

----- [1]

(ii) State the value of 13 MOD 4

----- [1]

OCR J277 · ExamBuilder Q38

7 (a) A programmer declares the following variables.

```
first = "Computer Science"
second = "is great"
```

Strings can be concatenated (joined together) using the + operator. For example, `print("Maths" + second)` will output `Maths is great`

Use string manipulation with the variables `first` and/or `second` to produce the following output.

(i) great

[1]

(ii) Computer

[1]

(iii) Science is great

[1]

(b) State the output from the following lines of program code.

(i) `print(first.length)`

[1]

(ii) `print(second.length DIV 3)`

[1]

(iii) `print(3 ^ 2)`

[1]

OCR J277 · ExamBuilder Q41(a)(b)

8 Write an algorithm in pseudocode to:

- store "Hello" in the variable `word1`
- store "Everyone" in the variable `word2`
- concatenate `word1` and `word2` to store "HelloEveryone" in the variable `message`

[3]

OCR J277 · ExamBuilder Q55(a)

- 9 **Stretch.** Louise writes a program to work out if a number entered by the user is odd or even. Her first attempt at this program is shown.

```
01 num = input("enter a number")
02 if num MOD 2 >= 0 then
03     print("even")
04 else
05     pritrn("odd")
06 endif
```

The program contains a logic error on line **02**.

- (i) State what is meant by a logic error.

[1]

- (ii) Give a corrected version of line **02** that fixes the logic error.
