1.B – Interactive Card: Specification & Designs

Unit 1: Interactive Animations & Games

Learning intentions

- Write a design specification that another person could actually build from
- Sketch and annotate several different design ideas
- Choose one design and justify the choice against your specification

Theory

You are a digital designer, and you are making an **interactive card** to give to someone.

Before anyone builds anything, they write down what it has to do. That written list is the **design specification**, and it is what **Criterion B: Developing ideas** is assessed on.

A specification is not a description of your idea. It is a list of requirements the finished thing must meet. The difference matters: a description can only be admired, a specification can be checked.

Take an ordinary object — a pair of trousers. A specification for them might say who they are for, what occasion they are for, and then list what they must do: lots of pockets, flared, light up, washable, waterproof, comfortable, turn into shorts. Some of those are sensible and some are ambitious, but every one of them is something you could later hold the finished trousers up against and ask: does it do this, yes or no?

Your card specification needs the same quality. Write requirements you can test later, because in Summative D you will test exactly that.

Sketches. Once the specification exists, you generate ideas — more than one. A sketch is meant to take **10 to 20 minutes**. It is not a highly detailed drawing, and it is not meant to be beautiful. What makes a sketch useful is the **annotation**: the written notes around the drawing that explain what each part does, especially the interactive parts. A sketch nobody else can interpret has failed at its job.

For the best marks you want **three or more** design ideas, each presented in reasonable detail, each annotated so another person could understand it.

Your sketches should show:

- how the card looks
- annotations explaining the interactive parts of the card

Keep these papers in your physical design portfolio, kept in class. Put your name on every sheet.

> **AI rule.** If AI is used to write the specification, that section scores **zero**. The specification is your design thinking — it is the part of the work that has to be yours.

Activity

Part 1 — Design specification. In your design notebook, decide and write down:

- what occasion the card is for
- what sort of person will receive it — a child or an adult, their interests, anything else that matters
- a list of elements the card must contain, including some **interactive** elements
- any other requirements — fonts, colours, sounds, size, how long it runs for

More detail earns a higher grade. Aim for a list a classmate could build from without asking you a single question.

Grading for the specification (Strand i):

- 1-2 marks: one or more basic success criteria listed
- 3-4 marks: a list of success criteria, three or more
- 5-6 marks: a reasonably detailed design specification
- 7-8 marks: a very detailed design specification

Part 2 — Design ideas. Sketch and annotate at least three different ideas for the card. Different means genuinely different — three versions of the same layout is one idea drawn three times.

Part 3 — Choose one. Pick the design you will build, and explain why you chose it over the others. The strongest answers explain the choice **using the specification**: this design meets these requirements better than that one did.

Grading for the design ideas (Strand ii):

- 1-2 marks: one design idea which can be interpreted
- 3-4 marks: more than one design idea which can be interpreted, or one design presented with a reasonable level of detail
- 5-6 marks: three or more design ideas presented in a reasonable level of detail
- 7-8 marks: three or more design ideas presented with a high level of detail

Questions

1. What occasion is your card for, and who is going to receive it?

2. What do you know about that person that should change the design? Think about their interests, their age, and what they would find funny or touching.

3. List the elements your card must contain. Number them, and mark the interactive ones with a star.

4. What other requirements does your card have? Consider fonts, colours, sound, how the card starts, and how the user knows what to do.

5. Describe design idea 1 in a sentence, and say what its main strength is.

6. Describe design idea 2 in a sentence, and say what its main strength is.

7. Describe design idea 3 in a sentence, and say what its main strength is.

8. Which design did you choose, and why? Refer to at least two specific points from your specification.

9. Which requirement in your specification do you think will be hardest to build? What might you do about that?

Extension

Give your specification to someone else in the class and ask them to describe, without seeing your sketches, what they think the card will look like. Where their description differs from what you intended, your specification was ambiguous. Rewrite those requirements so they are not.
