## 1.D – Evaluating the Interactive Card

*Unit 1: Interactive Animations & Games*

### Learning intentions

- Build a test plan and run it honestly against your finished card
- Gather and make use of critical feedback from other people
- Say precisely how you would improve the solution, and why

### Theory

This is **Criterion D: Evaluating**. Your card has already been graded for the build — so there is nothing to gain here by pretending it works better than it does, and a great deal to gain by testing it properly. **Do not fix broken code at this stage.** A test that fails and is recorded as failing is worth more marks than a test quietly removed.

**The test plan.** A test plan lists what you do, what should happen, and whether it actually did. Three columns, one row per thing worth testing:

| Action                   | Effect                             | Does it work? |
|--------------------------|------------------------------------|---------------|
| Screen 1, click on Santa | Santa jumps around                 | Yes           |
| Press 's'                | Screen changes to screen 2         | No            |
| Click 'run'              | Card displays the birthday message |               |

Include the simple things as well as the clever ones. “On start, the first screen displays as expected” is a perfectly good test. Aim for at least **five** tests, and more if your card does more. The best test plans cover **every** feature, not just the ones you are proud of.

**Feedback.** Ask **three** people for constructive, critical comments on your card. Constructive does not mean kind — a friend telling you it is great teaches you nothing. Ask them what confused them, what they tried that did not work, and what they expected to happen but did not. Then summarise what they said and discuss it: where do they agree, where do they disagree with each other, and where do you disagree with them?

**Improvements.** Finally, say how you would improve the card. Specific beats general every time. “Make it better” is worth nothing; “the instruction text is only on screen for two seconds, so I would leave it visible until the first key press” is worth a lot.

Grading for the test plan (Strand i):

- 1-2 marks: a test plan that is not relevant to your product
- 3-4 marks: a relevant test plan used and results presented
- 5-6 marks: a relevant test plan with at least five tests, results presented clearly
- 7-8 marks: a relevant test plan that is detailed and covers all features, with results presented clearly

Grading for improvements (Strand iii):

- 3-4 marks: lists one or two ways your card can be improved
- 5-6 marks: writes three or four specific ways your card can be improved, with some detail
- 7-8 marks: detailed discussion of how your card can be improved

Grading for use of feedback (Strand iv):

- 3-4 marks: briefly mentions comments from classmates
- 5-6 marks: discusses comments from classmates
- 7-8 marks: critically discusses in detail the comments from classmates

### Activity

Work through the five steps in your design workbook:

- Produce a test plan for your card, with an Action column, an Effect column, and a “Does it work?” column
- Run every test and fill in the final column honestly
- Ask three people for constructive, critical comments, then summarise and discuss them
- Note at least three things that are genuinely good about your card
- Discuss how you would improve it, drawing on the tests, the feedback, and your own view

### Questions

1. Write out your test plan. One line per test: the action, the effect you expected, and whether it worked.

---

---

2. Which tests failed? For each one, say what you think the cause was.

---

---

3. Reviewer 1 — what did they say? Summarise their comments.

---

---

4. Reviewer 2 — what did they say? Summarise their comments.

---

---

5. Reviewer 3 — what did they say? Summarise their comments.

---

---

6. Where did your three reviewers agree, and where did they disagree with each other?

---

---

7. Was there any feedback you disagree with? Say which, and why you would not act on it.

---

---

8. Three things that are genuinely good about your card, and what makes each one good.

---

---

9. How would you improve the card? Give at least three specific changes, and say what each one would fix.

---

---

10. Look back at the design specification you wrote in Summative B. Which requirements did the finished card actually meet, and which did it not?

---

---

#### Extension

Your specification was written before you knew how to build the card. Now that you do, write a short note to your past self: which requirements were unrealistic, which ones you should have included and did not, and what you would specify differently if you started this project again tomorrow.
