

L0 – First Meeting and Coverage Audit

OCR J277 Computer Science • papers summer 2027

Computer Science 11 • Mr. Rawson • 7 students

CS 11 Times	Wed 2 Sep, P5+P6 (Week B) P5 14:05–15:00 (55 min)	Next P6	Thu 3 Sep, P4 — tomorrow 15:05–15:55 (50 min), last of the day
Spec To print	J277 — whole-course audit 7 × course expectations (y11-computer-science-gcse.pdf); the audit (j277-coverage-audit.pdf) split by page — p.1 × 7 for students, p.2 × 1 for you. Page 2 is the teacher master with the inherited record. It is never issued to students and never published.	Lesson	L0 — precedes the sequence
Homework	None set — first meeting. [[ALEX: decide — they are back <i>tomorrow</i> (Thu P4); whether to set anything overnight, even just “bring your login”.]]		

By the end of the double:

- every student is greeted by name, name-tagged, and joined to Google Classroom;
- the course expectations have been delivered and the sheet is in their hands;
- an honest coverage picture of the whole J277 spec exists, tallied against the inherited record;
- you have a first read on whether “covered” means *secure* — and on whether anyone has ever actually written a program.

What this audit is for. This class is inherited mid-course, and the handover record is detailed but incomplete (≈ 31 recorded lessons against ≈ 70 slots). So today’s audit **tests the record against the students’ own sense of it**, across both papers. A row recorded **Yes** where several of the room tick *shaky* is the most valuable thing this lesson can surface. The two findings that matter most are on the notes page — read them before P6. And unlike the physics elevens, you see this class again **tomorrow**: the tally can be pitched into Thu P4 while it is still warm.

Timing — P5 (14:05–15:00)

Time	Phase	What happens
0–7	At the door	Greet each student at the door; name tags at the desks. Seven students — learn all seven names today, and say so.
7–10	Who I am	Brief. The expectations sheet carries the detail — do not lecture it twice.
10–22	Expectations	Walk the sheet (7 copies). Same delivery as the physics elevens in week one.
22–30	Google Classroom	Everyone joined before moving on. [[ALEX: decide — join code, and whether devices are to hand in PH1.]]
30–33	Frame the audit	Say it out loud: <i>not a test, not marked</i> . Guessing high costs them lessons they needed. One tick per row — and the list covers the <i>whole</i> course, so “New” will be a common and correct answer. Say that too, or the second half of the sheet will feel like failure.
33–48	The audit	Page 1 only, worked individually. With 7 students you can sit beside each one for a minute — do. The free-text lines at the bottom (“anything not on this list” / “worries you most”) are often the best data on the sheet.
48–55	Collect + buffer	Collect all 7. Quick first scan while they move; changeover is only five minutes, so keep the tally itself for P6.

Timing — P6 (15:05–15:55)

Time	Phase	What happens
0–8	Tally	While they settle: rapid tally against the inherited record (table overleaf). You are hunting disagreements , not totals — and watching the 2.2 rows in particular.
8–40	Something real	Not admin. [[ALEX: decide — the recommended option is the first-program diagnostic (notes page, with two alternatives). Whichever it is, this half-hour is the class’s first taste of how you teach — it should not be more talking.]]
40–48	The map	Show them the honest position at whatever altitude you choose: what is done, what is left, and that programming starts properly and soon. Frame it as “here is our run-in”, not as a deficit. [[ALEX: decide — how much of the gap to show them on day one, and the whole-year sequence; do not improvise mock dates in front of them.]]
48–50	Close	Tomorrow, P4, straight after lunch. Tell them what to bring. Last period of the day — end while the energy is still up.

The inherited record (from the audit's page 2)

Ref	Row	Record
1.1.1–2	CPU — FDE, registers, von Neumann; performance	Part
1.1.3	Embedded systems	Yes
1.2.1–5	Memory, storage, units, binary/hex/media, compression	Yes
1.3.1–2	Networks, topologies, protocols, layers	Yes
1.4.1	Network threats	Yes
1.4.2	Preventing attacks	No
1.5	Systems software	No
1.6.1	Ethics, legal, cultural, environmental	No
2.1.1	Computational thinking	No
2.1.2	Algorithms — trace tables only	Part
2.1.3	Searching and sorting	No
2.2	Programming — all of it	No
2.3	Defensive design and testing	No
2.4.1	Boolean logic	Yes
2.5	Languages, translators, the IDE	No

The two findings that matter most

- **Programming is three pages in the whole Y10 notebook** — trace tables, one Paper 2 question set, a printout. The capture states explicitly: no variables, no data types, no sequence, no selection, no iteration. The one sighting of code is `if (X AND Y): print("Yes!!")` inside a Boolean lesson — syntax *seen*, never written or run. On the evidence, **this class has never written a program**.
- **There is no test page anywhere in the notebook**. The only assessment-shaped artefact is a Paper 2 question set dated 5 May 2026. Assume almost no exam experience.

The honest problem — half the course, one year

13 of the 26 J277 sub-topics show no coverage at all, and **eleven of the fourteen outstanding sit in Paper 2** — which is 50% of the qualification, with Section B practical programming worth 30 of its 50 marks. They sit both papers in summer 2027. The capture's own analysis proposes an order (programming first, from zero, threaded alongside the Paper 1 remainder), but **the sequencing decision is yours and it shapes everything** — today's job is only to gather the evidence it gets made on. [[ALEX: decide — the year's sequence, before Thu P4 if possible; the tally sharpens it but should not delay it.]]

One trap before it fires: the existing j277-y11-course-overview.pdf was built for a clean two-year run — nine of its twelve sub-topics this class has already met, and it contains none of 2.1/2.2/2.3/2.5. **Do not issue it**. It needs rebuilding against the coverage table first.

P6 recommended option — first-program diagnostic (not decided)

The audit's biggest silence is 2.2, and no tick-sheet can measure it. Putting an editor in front of them converts the question into data: who can type, who has seen an IDE, who freezes. Shape: everyone types, runs and then modifies a five-line program — input, a variable, an if, two prints — so every student leaves having *run a program on day one*, which is also the statement of intent for the year. Needs: a machine per student and a working Python environment. [[ALEX: decide —

whether to run it, and in what environment (IDLE, an online editor, whatever PH1 actually has); check the room before committing.]]

Alternatives if machines are not certain: (a) retrieval quickfire on the claimed-Yes ground — binary↔denary, one hex conversion, a two-input truth table on whiteboards — which pitches directly off the audit; (b) bring the map forward and run the year-ahead conversation at full length. [[ALEX: decide.]]

For the claimed-Yes ground — errors to listen for

- **“The CPU is the brain”** — that is how the topic appears to have been taught. Probe past it: fetch–execute, registers and von Neumann have no evidence behind them.
- **Hex read as errors or “computer letters”** rather than base 16.
- **RAM described as where files are kept** — primary/secondary conflated.
- **AND/OR swapped in truth tables** — Boolean is recorded Yes, but it was three lessons in January.

Differentiation

Support: “New” is a fine answer — the sheet says so; with 7 students, say it again individually to anyone ticking slowly. If the diagnostic runs, the five-line program is typed from the board, not composed.

Extend: if the diagnostic runs, “make it do something else” — a second condition, a different message. Watch who reaches for it unprompted; that is data too.

After the lesson

- Flip this entry to **Taught** in the CS 11 Class Log.
- **Record every row where the room disagreed with the record** — especially Yes-but-shaky. That list, not the record, is what the run-in gets pitched at.
- Read the two free-text answers on all 7 sheets — “worries you most” in particular, given there may be exam anxiety with no exam experience under it.
- If the diagnostic ran: note who had clearly touched an editor before. That changes the pitch of the first programming unit more than the tick-sheet does.
- **Tomorrow is P4** — pitch it from tonight’s tally before the audit goes cold. [[ALEX: decide — what Thu 3 Sep P4 is; if the diagnostic ran, its natural sequel is the first real programming lesson.]]
- [[ALEX: decide — where the tally lives. The coverage table in RM Course Progression --- CS 2025-27.md is the obvious home (add a class-tally column beside the evidence column), or keep the paper master in the unit folder. Do not leave it only on paper.]]
