Name: _____

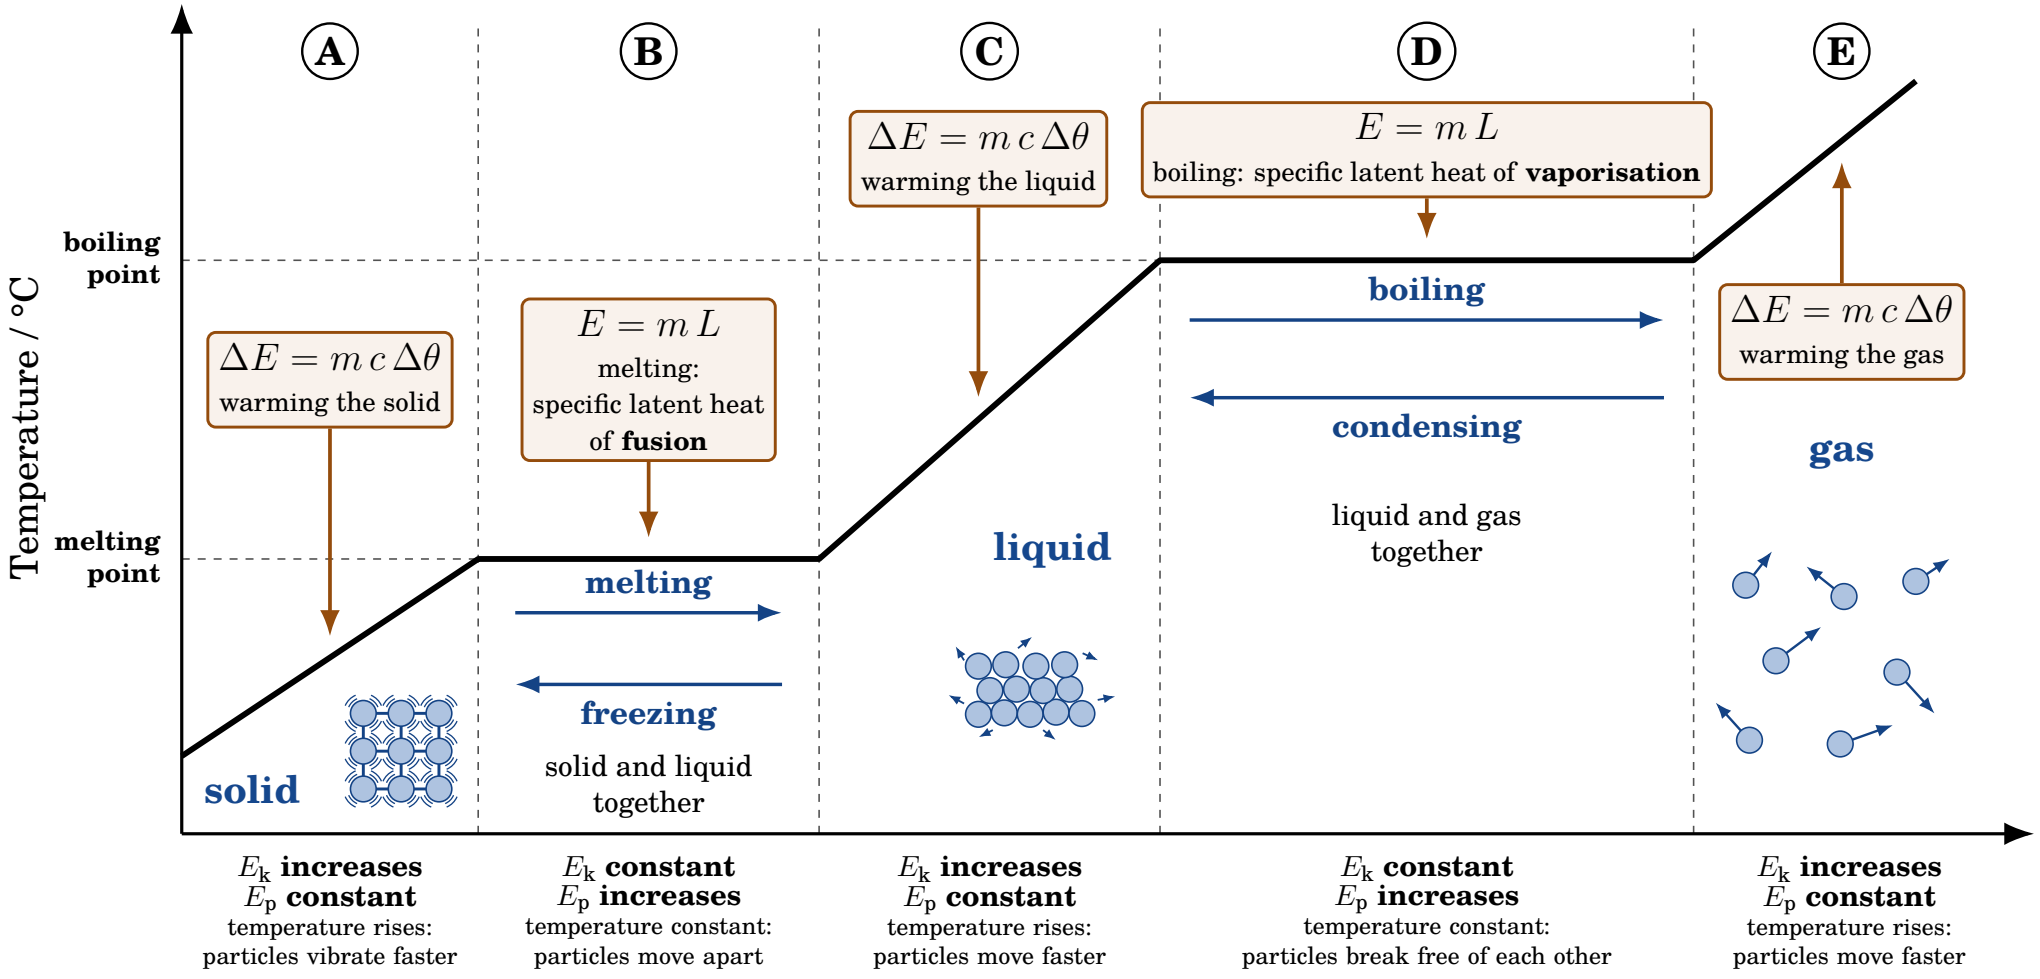

Class: _____

Date: _____

The Heating Curve

Mr. Rawson • GCSE Physics

Internal energy = kinetic energy E_k + potential energy E_p of all the particles: it increases the whole way →

Energy transferred ⟶ (with a steady heater, this is also time)

Cooling runs the graph right to left: condensing and freezing **transfer energy out**, at constant temperature.

Water: melts at 0 °C, boils at 100 °C.
